E01BGF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

E01BGF evaluates a piecewise cubic Hermite interpolant and its first derivative at a set of points.

2 Specification

```
SUBROUTINE E01BGF(N, X, F, D, M, PX, PF, PD, IFAIL)
INTEGER          N, M, IFAIL
double precision X(N), F(N), D(N), PX(M), PF(M), PD(M)
```

3 Description

E01BGF evaluates a piecewise cubic Hermite interpolant, as computed by E01BEF, at the points $PX(i)$, for $i = 1, 2, \dots, m$. The first derivatives at the points are also computed. If any point lies outside the interval from $X(1)$ to $X(N)$, values of the interpolant and its derivative are extrapolated from the nearest extreme cubic, and a warning is returned.

If values of the interpolant only, and not of its derivative, are required, E01BFF should be used.

The routine is derived from routine PCHFD in Fritsch (1982).

5 Parameters

- | | | |
|----|--|---------------|
| 1: | N – INTEGER | <i>Input</i> |
| 2: | X(N) – double precision array | <i>Input</i> |
| 3: | F(N) – double precision array | <i>Input</i> |
| 4: | D(N) – double precision array | <i>Input</i> |
| | <i>On entry:</i> N, X, F and D must be unchanged from the previous call of E01BEF. | |
| 5: | M – INTEGER | <i>Input</i> |
| | <i>On entry:</i> m, the number of points at which the interpolant is to be evaluated. | |
| | <i>Constraint:</i> $M \geq 1$. | |
| 6: | PX(M) – double precision array | <i>Input</i> |
| | <i>On entry:</i> the m values of x at which the interpolant is to be evaluated. | |
| 7: | PF(M) – double precision array | <i>Output</i> |
| | <i>On exit:</i> PF(i) contains the value of the interpolant evaluated at the point $PX(i)$, for $i = 1, 2, \dots, m$. | |
| 8: | PD(M) – double precision array | <i>Output</i> |
| | <i>On exit:</i> PD(i) contains the first derivative of the interpolant evaluated at the point $PX(i)$, for $i = 1, 2, \dots, m$. | |

9: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1 . If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0 . **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $N < 2$.

IFAIL = 2

The values of $X(r)$, for $r = 1, 2, \dots, N$, are not in strictly increasing order.

IFAIL = 3

On entry, $M < 1$.

IFAIL = 4

At least one of the points $PX(i)$, for $i = 1, 2, \dots, M$, lies outside the interval $[X(1), X(N)]$, and extrapolation was performed at all such points. Values computed at these points may be very unreliable.

7 Accuracy

The computational errors in the arrays PF and PD should be negligible in most practical situations.

8 Further Comments

The time taken by E01BGF is approximately proportional to the number of evaluation points, m . The evaluation will be most efficient if the elements of PX are in nondecreasing order (or, more generally, if they are grouped in increasing order of the intervals $[X(r-1), X(r)]$). A single call of E01BGF with $m > 1$ is more efficient than several calls with $m = 1$.

9 Example

This example reads in values of N, X, F and D, and calls E01BGF to compute the values of the interpolant and its derivative at equally spaced points.
