

NAG Library Routine Document

F07QVF (ZSPRFS)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F07QVF (ZSPRFS) returns error bounds for the solution of a complex symmetric system of linear equations with multiple right-hand sides, $AX = B$, using packed storage. It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

2 Specification

```

SUBROUTINE F07QVF(UPLO, N, NRHS, AP, AFP, IPIV, B, LDB, X, LDX, FERR,
1             BERR, WORK, RWORK, INFO)
    INTEGER          N, NRHS, IPIV(*), LDB, LDX, INFO
    double precision FERR(NRHS), BERR(NRHS), RWORK(N)
    complex*16       AP(*), AFP(*), B(LDB,*), X(LDX,*), WORK(2*N)
    CHARACTER*1      UPLO

```

The routine may be called by its LAPACK name ***zsprfs***.

3 Description

F07QVF (ZSPRFS) returns the backward errors and estimated bounds on the forward errors for the solution of a complex symmetric system of linear equations with multiple right-hand sides $AX = B$, using packed storage. The routine handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of F07QVF (ZSPRFS) in terms of a single right-hand side b and solution x .

Given a computed solution x , the routine computes the *component-wise backward error* β . This is the size of the smallest relative perturbation in each element of A and b such that x is the exact solution of a perturbed system

$$(\delta a_{ij} \leq \beta |a_{ij}| \quad \text{and} \quad | \delta b_i | \leq \beta |b_i|) \quad (A + \delta A)x = b + \delta b$$

Then the routine estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where $\hat{x}$ is the true solution.

For details of the method, see the F07 Chapter Introduction.

5 Parameters

- 1: UPLO – CHARACTER*1 *Input*
On entry: indicates whether the upper or lower triangular part of A is stored and how A is to be factorized.
UPLO = 'U'
The upper triangular part of A is stored and A is factorized as $PUDU^T P^T$, where U is upper triangular.
UPLO = 'L'
The lower triangular part of A is stored and A is factorized as $PLDL^T P^T$, where L is lower triangular.
Constraint: UPLO = 'U' or 'L'.
- 2: N – INTEGER *Input*
On entry: n , the order of the matrix A .
Constraint: $N \geq 0$.
- 3: NRHS – INTEGER *Input*
On entry: r , the number of right-hand sides.
Constraint: $NRHS \geq 0$.
- 4: AP(*) – **complex*16** array *Input*
Note: the dimension of the array AP must be at least $\max(1, N \times (N + 1)/2)$.
On entry: the n by n original symmetric matrix A as supplied to F07QRF (ZSPTRF).
- 5: AFP(*) – **complex*16** array *Input*
Note: the dimension of the array AFP must be at least $\max(1, N \times (N + 1)/2)$.
On entry: the factorization of A stored in packed form, as returned by F07QRF (ZSPTRF).
- 6: IPIV(*) – INTEGER array *Input*
Note: the dimension of the array IPIV must be at least $\max(1, N)$.
On entry: details of the interchanges and the block structure of D , as returned by F07QRF (ZSPTRF).
- 7: B(LDB,*) – **complex*16** array *Input*
Note: the second dimension of the array B must be at least $\max(1, NRHS)$.
On entry: the n by r right-hand side matrix B .
- 8: LDB – INTEGER *Input*
On entry: the first dimension of the array B as declared in the (sub)program from which F07QVF (ZSPRFS) is called.
Constraint: $LDB \geq \max(1, N)$.

- 9: $X(\text{LDX},*)$ – **complex*16** array *Input/Output*
Note: the second dimension of the array X must be at least $\max(1, \text{NRHS})$.
On entry: the n by r solution matrix X , as returned by F07QSF (ZSPTRS).
On exit: the improved solution matrix X .
- 10: LDX – INTEGER *Input*
On entry: the first dimension of the array X as declared in the (sub)program from which F07QVF (ZSPRFS) is called.
Constraint: $\text{LDX} \geq \max(1, N)$.
- 11: $\text{FERR}(\text{NRHS})$ – **double precision** array *Output*
On exit: $\text{FERR}(j)$ contains an estimated error bound for the j th solution vector, that is, the j th column of X , for $j = 1, 2, \dots, r$.
- 12: $\text{BERR}(\text{NRHS})$ – **double precision** array *Output*
On exit: $\text{BERR}(j)$ contains the component-wise backward error bound β for the j th solution vector, that is, the j th column of X , for $j = 1, 2, \dots, r$.
- 13: $\text{WORK}(2 \times N)$ – **complex*16** array *Workspace*
- 14: $\text{RWORK}(N)$ – **double precision** array *Workspace*
- 15: INFO – INTEGER *Output*
On exit: $\text{INFO} = 0$ unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

$\text{INFO} < 0$

If $\text{INFO} = -i$, the i th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The bounds returned in FERR are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Further Comments

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ real floating-point operations. Each step of iterative refinement involves an additional $24n^2$ real operations. At most five steps of iterative refinement are performed, but usually only one or two steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 5 and never more than 11. Each solution involves approximately $8n^2$ real operations.

The real analogue of this routine is F07PHF (DSPRFS).

9 Example

This example solves the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} -0.39 - 0.71i & 5.14 - 0.64i & -7.86 - 2.96i & 3.80 + 0.92i \\ 5.14 - 0.64i & 8.86 + 1.81i & -3.52 + 0.58i & 5.32 - 1.59i \\ -7.86 - 2.96i & -3.52 + 0.58i & -2.83 - 0.03i & -1.54 - 2.86i \\ 3.80 + 0.92i & 5.32 - 1.59i & -1.54 - 2.86i & -0.56 + 0.12i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -55.64 + 41.22i & -19.09 - 35.97i \\ -48.18 + 66.00i & -12.08 - 27.02i \\ -0.49 - 1.47i & 6.95 + 20.49i \\ -6.43 + 19.24i & -4.59 - 35.53i \end{pmatrix}.$$

Here A is symmetric, stored in packed form, and must first be factorized by F07QRF (ZSPTRF).
