NAG Library Routine Document

F07UVF (ZTPRFS)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F07UVF (ZTPRFS) returns error bounds for the solution of a complex triangular system of linear equations with multiple right-hand sides, $AX = B$, $A^{\mathrm{T}}X = B$ or $A^{\mathrm{H}}X = B$, using packed storage.

2 Specification

```
SUBROUTINE F07UVF(UPLO, TRANS, DIAG, N, NRHS, AP, B, LDB, X, LDX, FERR,
1                 BERR, WORK, RWORK, INFO)
INTEGER           N, NRHS, LDB, LDX, INFO
double precision  FERR(NRHS), BERR(NRHS), RWORK(N)
complex*16        AP(*), B(LDB,*), X(LDX,*), WORK(2*N)
CHARACTER*1       UPLO, TRANS, DIAG
```

The routine may be called by its LAPACK name ***ztprfs***.

3 Description

F07UVF (ZTPRFS) returns the backward errors and estimated bounds on the forward errors for the solution of a complex triangular system of linear equations with multiple right-hand sides $AX = B$, $A^{\mathrm{T}}X = B$ or $A^{\mathrm{H}}X = B$, using packed storage. The routine handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of F07UVF (ZTPRFS) in terms of a single right-hand side b and solution x.

Given a computed solution x, the routine computes the *component-wise backward error* β. This is the size of the smallest relative perturbation in each element of A and b such that x is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$
$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the routine estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where $\hat{x}$ is the true solution.

For details of the method, see the F07 Chapter Introduction.

5 Parameters

1: UPLO – CHARACTER*1 *Input*

On entry: indicates whether A is upper or lower triangular.

UPLO = 'U'
A is upper triangular.

UPLO = 'L'
A is lower triangular.

Constraint: UPLO = 'U' or 'L'.

2: TRANS – CHARACTER*1 *Input*

On entry: indicates the form of the equations

TRANS = 'N'
The equations are of the form $AX = B$.

TRANS = 'T'
The equations are of the form $A^{\mathrm{T}}X = B$.

TRANS = 'C'
The equations are of the form $A^{\mathrm{H}}X = B$.

Constraint: TRANS = 'N', 'T' or 'C'.

3: DIAG – CHARACTER*1 *Input*

On entry: indicates whether A is a nonunit or unit triangular matrix.

DIAG = 'N'
A is a nonunit triangular matrix.

DIAG = 'U'
A is a unit triangular matrix; the diagonal elements are not referenced and are assumed to be 1.

Constraint: DIAG = 'N' or 'U'.

4: N – INTEGER *Input*

On entry: n, the order of the matrix A.

Constraint: $\mathrm{N} \geq 0$.

5: NRHS – INTEGER *Input*

On entry: r, the number of right-hand sides.

Constraint: $\mathrm{NRHS} \geq 0$.

6: AP$(*)$ – ***complex*16*** array *Input*

Note: the dimension of the array AP must be at least $\max(1, \mathrm{N} \times (\mathrm{N}+1)/2)$.

On entry: the n by n triangular matrix A, packed by columns.

More precisely,

if UPLO = 'U', the upper triangle of A must be stored with element A_{ij} in $\mathrm{AP}(i + j(j-1)/2)$ for $i \leq j$;

if UPLO = 'L', the lower triangle of A must be stored with element A_{ij} in $\mathrm{AP}(i + (2n-j)(j-1)/2)$ for $i \geq j$.

If DIAG = 'U', the diagonal elements of A are assumed to be 1, and are not referenced; the same storage scheme is used whether DIAG = 'N' or 'U'.

7: B(LDB,$*$) – ***complex*16*** array *Input*

Note: the second dimension of the array B must be at least $\max(1, \mathrm{NRHS})$.

On entry: the n by r right-hand side matrix B.

8: LDB – INTEGER *Input*

On entry: the first dimension of the array B as declared in the (sub)program from which F07UVF (ZTPRFS) is called.

Constraint: LDB $\geq \max(1, \mathrm{N})$.

9: X(LDX,$*$) – ***complex*16*** array *Input*

Note: the second dimension of the array X must be at least $\max(1, \mathrm{NRHS})$.

On entry: the n by r solution matrix X, as returned by F07USF (ZTPTRS).

10: LDX – INTEGER *Input*

On entry: the first dimension of the array X as declared in the (sub)program from which F07UVF (ZTPRFS) is called.

Constraint: LDX $\geq \max(1, \mathrm{N})$.

11: FERR(NRHS) – ***double precision*** array *Output*

On exit: FERR(j) contains an estimated error bound for the jth solution vector, that is, the jth column of X, for $j = 1, 2, \ldots, r$.

12: BERR(NRHS) – ***double precision*** array *Output*

On exit: BERR(j) contains the component-wise backward error bound β for the jth solution vector, that is, the jth column of X, for $j = 1, 2, \ldots, r$.

13: WORK($2 \times$ N) – ***complex*16*** array *Workspace*

14: RWORK(N) – ***double precision*** array *Workspace*

15: INFO – INTEGER *Output*

On exit: INFO $= 0$ unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO $= -i$, the ith parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The bounds returned in FERR are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Further Comments

A call to F07UVF (ZTPRFS), for each right-hand side, involves solving a number of systems of linear equations of the form $Ax = b$ or $A^{\mathrm{H}}x = b$; the number is usually 5 and never more than 11. Each solution involves approximately $4n^2$ real floating-point operations.

The real analogue of this routine is F07UHF (DTPRFS).

9 Example

This example solves the system of equations $AX = B$ and to compute forward and backward error bounds, where

$$A = \begin{pmatrix} 4.78 + 4.56i & 0.00 + 0.00i & 0.00 + 0.00i & 0.00 + 0.00i \\ 2.00 - 0.30i & -4.11 + 1.25i & 0.00 + 0.00i & 0.00 + 0.00i \\ 2.89 - 1.34i & 2.36 - 4.25i & 4.15 + 0.80i & 0.00 + 0.00i \\ -1.89 + 1.15i & 0.04 - 3.69i & -0.02 + 0.46i & 0.33 - 0.26i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -14.78 - 32.36i & -18.02 + 28.46i \\ 2.98 - 2.14i & 14.22 + 15.42i \\ -20.96 + 17.06i & 5.62 + 35.89i \\ 9.54 + 9.91i & -16.46 - 1.73i \end{pmatrix},$$

using packed storage for A.
