NAG Library Routine Document

F07VSF (ZTBTRS)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F07VSF (ZTBTRS) solves a complex triangular band system of linear equations with multiple right-hand sides, $AX = B$, $A^{\mathrm{T}}X = B$ or $A^{\mathrm{H}}X = B$.

2 Specification

```
SUBROUTINE F07VSF(UPLO, TRANS, DIAG, N, KD, NRHS, AB, LDAB, B, LDB,
1                 INFO)
INTEGER           N, KD, NRHS, LDAB, LDB, INFO
complex*16        AB(LDAB,*), B(LDB,*)
CHARACTER*1       UPLO, TRANS, DIAG
```

The routine may be called by its LAPACK name ***ztbtrs***.

3 Description

F07VSF (ZTBTRS) solves a complex triangular band system of linear equations $AX = B$, $A^{\mathrm{T}}X = B$ or $A^{\mathrm{H}}X = B$.

4 References

Golub G H and Van Loan C F (1996) *Matrix Computations* (3rd Edition) Johns Hopkins University Press, Baltimore

Higham N J (1989) The accuracy of solutions to triangular systems *SIAM J. Numer. Anal.* **26** 1252–1265

5 Parameters

1: UPLO – CHARACTER*1 *Input*

On entry: indicates whether A is upper or lower triangular.

UPLO = 'U'
A is upper triangular.

UPLO = 'L'
A is lower triangular.

Constraint: UPLO = 'U' or 'L'.

2: TRANS – CHARACTER*1 *Input*

On entry: indicates the form of the equations

TRANS = 'N'
The equations are of the form $AX = B$.

TRANS = 'T'
The equations are of the form $A^{\mathrm{T}}X = B$.

TRANS = 'C'
The equations are of the form $A^{\mathrm{H}}X = B$.

Constraint: TRANS = 'N', 'T' or 'C'.

3: DIAG – CHARACTER*1 *Input*

On entry: indicates whether A is a nonunit or unit triangular matrix.

DIAG = 'N'
A is a nonunit triangular matrix.

DIAG = 'U'
A is a unit triangular matrix; the diagonal elements are not referenced and are assumed to be 1.

Constraint: DIAG = 'N' or 'U'.

4: N – INTEGER *Input*

On entry: n, the order of the matrix A.

Constraint: N ≥ 0.

5: KD – INTEGER *Input*

On entry: k_d, the number of superdiagonals of the matrix A if UPLO = 'U', or the number of subdiagonals if UPLO = 'L'.

Constraint: KD ≥ 0.

6: NRHS – INTEGER *Input*

On entry: r, the number of right-hand sides.

Constraint: NRHS ≥ 0.

7: AB(LDAB,$*$) – ***complex*16*** array *Input*

Note: the second dimension of the array AB must be at least $\max(1, \mathrm{N})$.

On entry: the n by n triangular band matrix A.

The matrix is stored in rows 1 to $k_d + 1$, more precisely,

if UPLO = 'U', the elements of the upper triangle of A within the band must be stored with element A_{ij} in $\mathrm{AB}(k_d + 1 + i - j, j)$ for $\max(1, j - k_d) \leq i \leq j$;

if UPLO = 'L', the elements of the lower triangle of A within the band must be stored with element A_{ij} in $\mathrm{AB}(1 + i - j, j)$ for $j \leq i \leq \min(n, j + k_d)$.

If DIAG = 'U', the diagonal elements of A are assumed to be 1, and are not referenced.

8: LDAB – INTEGER *Input*

On entry: the first dimension of the array AB as declared in the (sub)program from which F07VSF (ZTBTRS) is called.

Constraint: LDAB $\geq$ KD + 1.

9: B(LDB,$*$) – ***complex*16*** array *Input/Output*

Note: the second dimension of the array B must be at least $\max(1, \mathrm{NRHS})$.

On entry: the n by r right-hand side matrix B.

On exit: the n by r solution matrix X.

10: LDB – INTEGER *Input*

On entry: the first dimension of the array B as declared in the (sub)program from which F07VSF (ZTBTRS) is called.

Constraint: LDB $\geq \max(1, \mathrm{N})$.

11: INFO – INTEGER *Output*

On exit: INFO $= 0$ unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO $= -i$, the ith parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

If INFO $= i$, $a(i,i)$ is exactly zero; A is singular and the solution has not been computed.

7 Accuracy

The solutions of triangular systems of equations are usually computed to high accuracy. See Higham (1989).

For each right-hand side vector b, the computed solution x is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(k)\epsilon|A|,$$

$c(k)$ is a modest linear function of k, and ϵ is the ***machine precision***.

If $\hat{x}$ is the true solution, then the computed solution x satisfies a forward error bound of the form

$$\frac{\|x - \hat{x}\|_\infty}{\|x\|_\infty} \leq c(k)\,\mathrm{cond}(A,x)\epsilon, \qquad \text{provided} \qquad c(k)\,\mathrm{cond}(A,x)\epsilon < 1,$$

where $\mathrm{cond}(A,x) = \left\| |A^{-1}||A||x| \right\|_\infty / \|x\|_\infty$.

Note that $\mathrm{cond}(A,x) \leq \mathrm{cond}(A) = \left\| |A^{-1}||A| \right\|_\infty \leq \kappa_\infty(A)$; $\mathrm{cond}(A,x)$ can be much smaller than $\mathrm{cond}(A)$ and it is also possible for $\mathrm{cond}\left(A^{\mathrm{H}}\right)$, which is the same as $\mathrm{cond}\left(A^{\mathrm{T}}\right)$, to be much larger (or smaller) than $\mathrm{cond}(A)$.

Forward and backward error bounds can be computed by calling F07VVF (ZTBRFS), and an estimate for $\kappa_\infty(A)$ can be obtained by calling F07VUF (ZTBCON) with NORM = 'I'.

8 Further Comments

The total number of real floating-point operations is approximately $8nkr$ if $k \ll n$.

The real analogue of this routine is F07VEF (DTBTRS).

9 Example

This example solves the system of equations $AX = B$, where

$$A = \begin{pmatrix} -1.94 + 4.43i & 0.00 + 0.00i & 0.00 + 0.00i & 0.00 + 0.00i \\ -3.39 + 3.44i & 4.12 - 4.27i & 0.00 + 0.00i & 0.00 + 0.00i \\ 1.62 + 3.68i & -1.84 + 5.53i & 0.43 - 2.66i & 0.00 + 0.00i \\ 0.00 + 0.00i & -2.77 - 1.93i & 1.74 - 0.04i & 0.44 + 0.10i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -8.86 - 3.88i & -24.09 - 5.27i \\ -15.57 - 23.41i & -57.97 + 8.14i \\ -7.63 + 22.78i & 19.09 - 29.51i \\ -14.74 - 2.40i & 19.17 + 21.33i \end{pmatrix}.$$

Here A is treated as a lower triangular band matrix with two subdiagonals.
