F08SSF (ZHEGST)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F08SSF (ZHEGST) reduces a complex Hermitian-definite generalized eigenproblem $Az = \lambda Bz$, $ABz = \lambda z$ or $BAz = \lambda z$ to the standard form $Cy = \lambda y$, where A is a complex Hermitian matrix and B has been factorized by F07FRF (ZPOTRF).

2 Specification

```
SUBROUTINE F08SSF(ITYPE, UPLO, N, A, LDA, B, LDB, INFO)
INTEGER          ITYPE, N, LDA, LDB, INFO
complex*16      A(LDA,*), B(LDB,*)
CHARACTER*1      UPLO
```

The routine may be called by its LAPACK name ***zhegst***.

3 Description

To reduce the complex Hermitian-definite generalized eigenproblem $Az = \lambda Bz$, $ABz = \lambda z$ or $BAz = \lambda z$ to the standard form $Cy = \lambda y$, F08SSF (ZHEGST) must be preceded by a call to F07FRF (ZPOTRF) which computes the Cholesky factorization of B ; B must be positive-definite.

The different problem types are specified by the parameter ITYPE, as indicated in the table below. The table shows how C is computed by the routine, and also how the eigenvectors z of the original problem can be recovered from the eigenvectors of the standard form.

ITYPE	Problem	UPLO	B	C	z
1	$Az = \lambda Bz$	'U' 'L'	$U^H U$ LL^H	$U^{-H} A U^{-1}$ $L^{-1} A L^{-H}$	$U^{-1} y$ $L^{-H} y$
2	$ABz = \lambda z$	'U' 'L'	$U^H U$ LL^H	$U A U^H$ $L^H A L$	$U^{-1} y$ $L^{-H} y$
3	$BAz = \lambda z$	'U' 'L'	$U^H U$ LL^H	$U A U^H$ $L^H A L$	$U^H y$ $L y$

5 Parameters

- 1: ITYPE – INTEGER *Input*
On entry: indicates how the standard form is computed.
 ITYPE = 1
 if UPLO = 'U', $C = U^{-H}AU^{-1}$;
 if UPLO = 'L', $C = L^{-1}AL^{-H}$.
 ITYPE = 2 or 3
 if UPLO = 'U', $C = UAU^H$;
 if UPLO = 'L', $C = L^H AL$.
Constraint: ITYPE = 1, 2 or 3.
- 2: UPLO – CHARACTER*1 *Input*
On entry: indicates whether the upper or lower triangular part of A is stored and how B has been factorized.
 UPLO = 'U'
 The upper triangular part of A is stored and $B = U^H U$.
 UPLO = 'L'
 The lower triangular part of A is stored and $B = LL^H$.
Constraint: UPLO = 'U' or 'L'.
- 3: N – INTEGER *Input*
On entry: n , the order of the matrices A and B .
Constraint: $N \geq 0$.
- 4: A(LDA,*) – **complex*16** array *Input/Output*
Note: the second dimension of the array A must be at least $\max(1, N)$.
On entry: the n by n Hermitian matrix A .
 If UPLO = 'U', the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.
 If UPLO = 'L', the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.
On exit: the upper or lower triangle of A is overwritten by the corresponding upper or lower triangle of C as specified by ITYPE and UPLO.
- 5: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F08SSF (ZHEGST) is called.
Constraint: $LDA \geq \max(1, N)$.

- 6: B(LDB,*) – **complex*16** array *Input*
Note: the second dimension of the array B must be at least $\max(1, N)$.
On entry: the Cholesky factor of B as specified by UPLO and returned by F07FRF (ZPOTRF).
- 7: LDB – INTEGER *Input*
On entry: the first dimension of the array B as declared in the (sub)program from which F08SSF (ZHEGST) is called.
Constraint: $LDB \geq \max(1, N)$.
- 8: INFO – INTEGER *Output*
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = $-i$, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

Forming the reduced matrix C is a stable procedure. However it involves implicit multiplication by B^{-1} (if ITYPE = 1) or B (if ITYPE = 2 or 3). When F08SSF (ZHEGST) is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion. See the document for F08SNF (ZHEGV) for further details.

8 Further Comments

The total number of real floating-point operations is approximately $4n^3$.

The real analogue of this routine is F08SEF (DSYGST).

9 Example

This example computes all the eigenvalues of $Az = \lambda Bz$, where

$$A = \begin{pmatrix} -7.36 + 0.00i & 0.77 - 0.43i & -0.64 - 0.92i & 3.01 - 6.97i \\ 0.77 + 0.43i & 3.49 + 0.00i & 2.19 + 4.45i & 1.90 + 3.73i \\ -0.64 + 0.92i & 2.19 - 4.45i & 0.12 + 0.00i & 2.88 - 3.17i \\ 3.01 + 6.97i & 1.90 - 3.73i & 2.88 + 3.17i & -2.54 + 0.00i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 3.23 + 0.00i & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\ 1.51 + 1.92i & 3.58 + 0.00i & -0.23 + 1.11i & -1.18 + 1.37i \\ 1.90 - 0.84i & -0.23 - 1.11i & 4.09 + 0.00i & 2.33 - 0.14i \\ 0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29 + 0.00i \end{pmatrix}.$$

Here B is Hermitian positive-definite and must first be factorized by F07FRF (ZPOTRF). The program calls F08SSF (ZHEGST) to reduce the problem to the standard form $Cy = \lambda y$; then F08FSF (ZHETRD) to reduce C to tridiagonal form, and F08JFF (DSTERF) to compute the eigenvalues.
