

NAG Library Routine Document

G08AFF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

G08AFF performs the Kruskal–Wallis one-way analysis of variance by ranks on k independent samples of possibly unequal sizes.

2 Specification

```
SUBROUTINE G08AFF(X, LX, L, K, W, H, P, IFAIL)
INTEGER          LX, L(K), K, IFAIL
double precision X(LX), W(LX), H, P
```

3 Description

The Kruskal–Wallis test investigates the differences between scores from k independent samples of unequal sizes, the i th sample containing l_i observations. The hypothesis under test, H_0 , often called the null hypothesis, is that the samples come from the same population, and this is to be tested against the alternative hypothesis H_1 that they come from different populations.

The test proceeds as follows:

- The pooled sample of all the observations is ranked. Average ranks are assigned to tied scores.
- The ranks of the observations in each sample are summed, to give the rank sums R_i , for $i = 1, 2, \dots, k$.
- The Kruskal–Wallis' test statistic H is computed as:

$$H = \frac{12}{N(N+1)} \sum_{i=1}^k \frac{R_i^2}{l_i} - 3(N+1), \quad \text{where } N = \sum_{i=1}^k l_i,$$

i.e., N is the total number of observations. If there are tied scores, H is corrected by dividing by:

$$1 - \frac{\sum (t^3 - t)}{N^3 - N}$$

where t is the number of tied scores in a group and the summation is over all tied groups.

G08AFF returns the value of H , and also an approximation, p , to the probability of a value of at least H being observed, H_0 is true. (H approximately follows a χ_{k-1}^2 distribution). H_0 is rejected by a test of chosen size α if $p < \alpha$. The approximation p is acceptable unless $k = 3$ and l_1, l_2 or $l_3 \leq 5$ in which case tables should be consulted (e.g., O of Siegel (1956)) or $k = 2$ (in which case the Median test (see G08ACF) or the Mann–Whitney U test (see G08AHF) is more appropriate).

5 Parameters

- 1: $X(LX)$ – *double precision* array *Input*
On entry: the elements of X must contain the observations in the K groups. The first l_1 elements must contain the scores in the first group, the next l_2 those in the second group, and so on.

- 2: LX – INTEGER *Input*
On entry: N , the total number of observations.
Constraint: $LX = \sum_{i=1}^k L(i)$.

- 3: $L(K)$ – INTEGER array *Input*
On entry: $L(i)$ must contain the number of observations l_i in sample i , for $i = 1, 2, \dots, k$.
Constraint: $L(i) > 0$, for $i = 1, 2, \dots, k$.

- 4: K – INTEGER *Input*
On entry: k , the number of samples.
Constraint: $K \geq 2$.

- 5: $W(LX)$ – *double precision* array *Workspace*

- 6: H – *double precision* *Output*
On exit: the value of the Kruskal–Wallis test statistic, H .

- 7: P – *double precision* *Output*
On exit: the approximate significance, p , of the Kruskal–Wallis test statistic.

- 8: $IFAIL$ – INTEGER *Input/Output*
On entry: $IFAIL$ must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.
On exit: $IFAIL = 0$ unless the routine detects an error (see Section 6).
For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of $IFAIL$ on exit.**

6 Error Indicators and Warnings

If on entry $IFAIL = 0$ or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

$IFAIL = 1$

On entry, $K < 2$.

$IFAIL = 2$

On entry, $L(i) \leq 0$ for some i , $i = 1, 2, \dots, k$.

IFAIL = 3

On entry, $LX \neq \sum_{i=1}^k L(i)$.

IFAIL = 4

On entry, all the observations were equal.

7 Accuracy

For estimates of the accuracy of the significance p , see G01ECF. The χ^2 approximation is acceptable unless $k = 3$ and l_1, l_2 or $l_3 \leq 5$.

8 Further Comments

The time taken by G08AFF is small, and increases with N and k .

If $k = 2$, the Median test (see G08ACF) or the Mann–Whitney U test (see G08AHF) is more appropriate.

9 Example

This example is taken from Moore *et al.* (1972). There are 5 groups of sizes 5, 8, 6, 8 and 8. The data represent the weight gain, in pounds, of pigs from five different litters under the same conditions.
