

NAG Library Routine Document

G10CAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

G10CAF computes a smoothed data sequence using running median smoothers.

2 Specification

```
SUBROUTINE G10CAF(ITYPE, N, Y, SMOOTH, ROUGH, IFAIL)
INTEGER          ITYPE, N, IFAIL
double precision  Y(N), SMOOTH(N), ROUGH(N)
```

3 Description

Given a sequence of n observations recorded at equally spaced intervals, G10CAF fits a smooth curve through the data using one of two smoothers. The two smoothers are based on the use of running medians and averages to summarize overlapping segments. The fit and the residuals are called the smooth and the rough respectively. They obey the following:

$$\text{Data} = \text{Smooth} + \text{Rough}.$$

The two smoothers are:

1. 4253H,twice consisting of a running median of 4, then 2, then 5, then 3 followed by hanning. Hanning is a running weighted average, the weights being $1/4$, $1/2$ and $1/4$. The result of this smoothing is then reroughed by computing residuals, applying the same smoother to them and adding the result to the smooth of the first pass.
2. 3RSSH,twice consisting of a running median of 3, two splitting operations named S to improve the smooth sequence, each of which is followed by a running median of 3, and finally hanning. The end points are dealt with using the method described by Velleman and Hoaglin (1981). The full smoother 3RSSH,twice is produced by reroughing as described above.

The compound smoother 4253H,twice is recommended. The smoother 3RSSH,twice is popular when calculating by hand as it requires simpler computations and is included for comparison purposes.

5 Parameters

- 1: ITYPE – INTEGER *Input*
- On entry:* specifies the method to be used.
- If ITYPE = 0, 4253H,twice is used.
- If ITYPE = 1, 3RSSH,twice is used.
- Constraint:* ITYPE = 0 or 1.

- 2: N – INTEGER *Input*
On entry: n , the number of observations.
Constraint: $N > 6$.
- 3: Y(N) – *double precision* array *Input*
On entry: the sample observations.
- 4: SMOOTH(N) – *double precision* array *Output*
On exit: contains the smooth.
- 5: ROUGH(N) – *double precision* array *Output*
On exit: contains the rough.
- 6: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.
On exit: IFAIL = 0 unless the routine detects an error (see Section 6).
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, ITYPE < 0,
 or ITYPE > 1.

IFAIL = 2

On entry, $N \leq 6$.

7 Accuracy

Not applicable.

8 Further Comments

Alternative methods of smoothing include the use of splines; see G10ABF and G10ACF.

9 Example

This example reads in a sequence of 49 observations on bituminous coal production (in millions of net tons per year) in the USA., 1920–1968 and is taken from Tukey (1977). For comparison purposes, both smoothers are applied to the data and the results are printed.
