

NAG Library Routine Document

S15AGF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

S15AGF returns the value of the scaled complementary error function $\text{erfcx}(x)$, via the routine name.

2 Specification

double precision FUNCTION S15AGF(X, IFAIL)
 INTEGER IFAIL
double precision X

3 Description

S15AGF calculates an approximate value for the scaled complementary error function

$$\text{erfcx}(x) = e^{x^2} \text{erfc}(x) = \frac{2}{\sqrt{\pi}} e^{x^2} \int_x^\infty e^{-t^2} dt = e^{x^2} (1 - \text{erf}(x)).$$

Let $\hat{x}$ be the root of the equation $\text{erfc}(x) - \text{erf}(x) = 0$ (then $\hat{x} \approx 0.46875$). For $|x| \leq \hat{x}$ the value of $\text{erfcx}(x)$ is based on the following rational Chebyshev expansion for $\text{erf}(x)$:

$$\text{erf}(x) \approx x R_{\ell,m}(x^2),$$

where $R_{\ell,m}$ denotes a rational function of degree ℓ in the numerator and m in the denominator.

For $|x| > \hat{x}$ the value of $\text{erfcx}(x)$ is based on a rational Chebyshev expansion for $\text{erfc}(x)$: for $\hat{x} < |x| \leq 4$ the value is based on the expansion

$$\text{erfc}(x) \approx e^{x^2} R_{\ell,m}(x);$$

and for $|x| > 4$ it is based on the expansion

$$\text{erfc}(x) \approx \frac{e^{x^2}}{x} \left(\frac{1}{\sqrt{\pi}} + \frac{1}{x^2} R_{\ell,m}(1/x^2) \right).$$

For each expansion, the specific values of ℓ and m are selected to be minimal such that the maximum relative error in the expansion is of the order 10^{-d} , where d is the maximum number of decimal digits that can be accurately represented for the particular implementation (see X02BEF).

Asymptotically, $\text{erfcx}(x) \sim 1/(\sqrt{\pi} \text{abs}(x))$. There is a danger of setting underflow in $\text{erfcx}(x)$ whenever $x \geq x_{\text{hi}} = \min(x_{\text{huge}}, 1/(\sqrt{\pi} x_{\text{tiny}}))$, where x_{huge} is the largest positive model number (see X02ALF) and x_{tiny} is the smallest positive model number (see X02AKF). In this case S15AGF exits with IFAIL = 1 and returns $\text{erfcx}(x) = 0$. For x in the range $1/(2\sqrt{\epsilon}) \leq x < x_{\text{hi}}$, where ϵ is the ***machine precision***, the asymptotic value $1/(\sqrt{\pi} \text{abs}(x))$ is returned for $\text{erfcx}(x)$ and S15AGF exits with IFAIL = 2.

There is a danger of setting overflow in e^{x^2} whenever $x < x_{\text{neg}} = -\sqrt{\log(x_{\text{huge}}/2)}$. In this case S15AGF exits with IFAIL = 3 and returns $\text{erfcx}(x) = x_{\text{huge}}$.

The values of x_{hi} , $1/(2\sqrt{\epsilon})$ and x_{neg} are given in the Users' Note for your implementation.

5 Parameters

1: X – *double precision* *Input*

On entry: the argument x of the function.

2: IFAIL – INTEGER *Input/Output*

On entry: IFAIL must be set to 0, -1 or 1 . If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, because for this routine the values of the output parameters may be useful even if IFAIL $\neq 0$ on exit, the recommended value is -1 . **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Note: S15AGF may return useful information for one or more of the following detected errors or warnings.

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $X \geq x_{hi}$ (see Section 3). On soft failure the function value returned is 0.

IFAIL = 2

On entry, $1/(2\sqrt{\epsilon}) \leq X < x_{hi}$ (see Section 3). On soft failure the function value returned is $1/(\sqrt{\pi} \text{abs}(X))$.

IFAIL = 3

On entry, $X < x_{neg}$ (see Section 3). On soft failure the function value returned is the largest positive model number.

7 Accuracy

The relative error in computing $\text{erfcx}(x)$ may be estimated by evaluating

$$E = \frac{\text{erfcx}(x) - e^{x^2} \sum_{n=1}^{\infty} I^n \text{erfc}(x)}{\text{erfcx}(x)},$$

where I^n denotes repeated integration. Empirical results suggest that on the interval $(\hat{x}, 2)$ the loss in base b significant digits for maximum relative error is around 3.3, while for root-mean-square relative error on that interval it is 1.2 (see X02BHF for the definition of the model parameter b). On the interval $(2, 20)$ the values are around 3.5 for maximum and 0.45 for root-mean-square relative errors; note that on these two intervals $\text{erfc}(x)$ is the primary computation. See also Section 7 in S15ADF.

8 Further Comments

None.

9 Example

This example reads values of the argument x from a file, evaluates the function at each value of x and prints the results.
